

USER GUIDE

Marriage Register OCR

A step-by-step walkthrough — from signing in to correcting an extracted record — written for reviewers with no technical background.

Covers: signing in · creating a batch · submitting a OneDrive link · tracking jobs · reviewing and correcting records · exporting results

GETTING STARTED

1 Signing in

Every action in this system requires an account. Ask your administrator for your email and password if you don't have one yet.

SIGN-IN SCREEN

Email

Password

- 1 Open the site in your browser.
- 2 Type your **Email** and **Password** into the two boxes.
- 3 Click .

Two kinds of accounts. An **Admin** can do everything, including delete batches, links, records, and exports. A **Reviewer** can do everything except delete — any button simply won't appear for a Reviewer account. Both can submit links, review records, and correct data.

ORGANIZING WORK

2 Creating a batch

A **batch** is a folder for one set of registers — for example, all the pages from one physical volume. You'll create a batch before submitting any files to it.

CREATE A BATCH

Create batch

- 1 On the home page, find the **Create a batch** section at the top.
- 2 Type a short, recognizable **Name** — something that tells you what's inside at a glance.
- 3 Optionally add a **Description** with more detail.
- 4 Click . It appears immediately in the **Batches** list below, and you're ready to add files to it.
- 5 Click the batch's name at any time to open it.

ADDING FILES

3 Submitting a OneDrive link

Files are added to a batch by pasting a OneDrive share link — not by uploading files directly. One link can point to a whole folder, and every file inside it is picked up automatically.

SUBMIT A ONEDRIVE LINK

Submit link

- 1 Open the batch you want to add files to.
- 2 Find the **Submit a OneDrive link** section.
- 3 Paste the OneDrive share link into the box.
- 4 Click `Submit link` (or press Enter).

WHAT HAPPENS NEXT

The system downloads every file the link points to, figures out on its own whether each page is handwritten or typed and which register type it is (Nikah, Cerai, or Rujuk), then starts extracting the data. You'll see a banner — *"1 link(s) downloading and classifying — this can take a few minutes for many files"* — while this is in progress. This is normal; larger folders simply take longer. You don't need to keep the page open — check back later.

IF A LINK FAILS

It will show a **FAILED** tag with a short error message underneath. Click the `Retry` link next to it to try again — for example, after fixing a sharing-permission problem on the OneDrive side.

TRACKING PROGRESS

4 Watching jobs process

Each page from your files becomes one **job**. The **Jobs** section on the batch page lists every one of them, with its own status.

STATUS	WHAT IT MEANS
PENDING	Waiting in line to be processed.
PROCESSING	Being read right now.
COMPLETED	Done. Its data is ready to review below.
FAILED	Something went wrong. An error message is shown; click Retry to try again.
CANCELLED	Stopped manually (see below). Can also be retried.

- 1 Use the status dropdown above the job list to filter (for example, show only **Failed** jobs).
- 2 For a **COMPLETED** job, click **View records** to see the data extracted from that page right there, or **Download** to get the original file.
- 3 For a **FAILED** or **CANCELLED** job, click **Retry**.

STOPPING A BATCH

While a batch shows **PROCESSING**, a **Stop processing** button appears at the top. Clicking it cancels every job that hasn't started yet and stops any that are currently running — useful if you submitted the wrong link and want to abort before it finishes.

THE MOST IMPORTANT STEP

5 Reviewing and correcting records

Once a job completes, it produces one or more **records** — the actual extracted data (names, IC numbers, dates, and so on). This is where you check the computer's work and fix anything it got wrong or couldn't read.

You can reach the records table in three places, all working the same way:

- 1 Click **View records** on any completed job, to see just that page's data.
- 2 Scroll to the **Review queue** section on the batch page, to see every record in the batch at once, with search and filter tools.
- 3 On the home page, use **All records** to search across every batch at the same time.

RECORDS TABLE			
Status	File	Full Name	IC Number
Needs review	page_04.pdf	Ahmad bin Ismail	(click to fill in)

Understanding a record's status

STATUS	WHAT IT MEANS
Needs review	At least one field couldn't be read confidently and is left for you to fill in — its cell is highlighted and already open for typing.
Complete	Every field is filled in. No action needed unless you spot a mistake.

How to correct a field

- 1 Find the record's row, and the column for the field you want to fix (for example, **Full Name** or **IC Number**).
- 2 If the cell has a pale orange background, it's a field the system couldn't read — it's already open for you to type into directly. For any other cell, **click it once** to open it for editing.
- 3 Type the correct value.
- 4 Click anywhere else, or press **Enter**, to save. There's no separate save button — it saves the moment you click away.

ONCE EVERY FLAGGED FIELD IS FILLED IN

The record's status automatically changes from **Needs review** to **Complete** — there's no separate "approve" button to click. Simply filling in the missing information is enough.

CHECKING AGAINST THE ORIGINAL

Click the file name shown in the **File** column (for example `page_04.pdf`) to open the original scanned page in a new tab, so you can compare it side-by-side with what was extracted before correcting anything.

Admin accounts see a **Delete** link at the end of each row, for removing a record that shouldn't exist at all (for example, a duplicate or a blank page misread as data). Reviewer accounts don't see this option — they can correct data freely, but not delete it.

6 Exporting results

Once you're happy with a batch's records, export them to a spreadsheet.

EXPORT

XLSX ▾

Generate export

- 1 Open the batch and scroll to the **Export** section at the bottom.
- 2 Choose a format: XLSX (Excel) or CSV.
- 3 Click Generate export.
- 4 Wait for its status to reach COMPLETED, then click Download.

TIP

You can generate as many exports as you like — for example, one now and another later after making more corrections. Each one is saved in the list with its own download link.
